## OPTIMISASI STATION HEAT RATE DENGAN MENGATUR TINGKAT PEMBEBANAN UNIT 5 & 6 DI PLTU PAITON II

# RINGKASAN UTAMA (Executive Summary)

Telah dilakukan pengujian kinerja heat rate (heat rate performance test) unit 5 dan 6 di PLTU Paiton II dengan 4 tingkat pembebanan : 450 MW, 500 MW, 550 MW dan 610 MW (100% beban). Secara keseluruhan tujuan utama rangkaian pengujian ini adalah mendapatkan tingkat pembebanan optimum dari masingmasing unit yang menghasilkan efisiensi termal plant tertinggi disaat memenuhi tiap tingkat beban (dispatch) plant yang diminta PLN-P3B.

Pelaksanaan pengujian kinerja heat rate unit 5 dilakukan dalam rentang waktu dari tanggal 12 Februari 2015 sampai dengan 22 April 2015. Sedangkan Unit 6 dilaksanakan pada rentang waktu 9 Desember 2014 hingga 23 September 2015. Hasil yang didapatkan adalah sebagai berikut:

#### a. Data Unit 50

NO	ITEMS	UNIT	LOAD (MW NETT)			)
	TIEMS	UNIT	455.18	502.71	551.32	606.49
1	Corrected Gross Turbine Heat Rate	kCal/kwh	1911.19	1956.30	1954.45	1981.85
2	Boiler Efficiency Test Result (LHV)	%	93.177	93.178	93.162	92.805
3	Net Heat Rate Test Result	kCal/kwh	2152.75	2202.32	2197.33	2231.91
4	Plant Efficiency	%	39.94	39.04	39.13	38.53

#### b. Data Unit 60

NO	ITEMS	UNIT	LOAD (MW NETT)					
	TILIMS	ONIT	458.10	506.34	554.39	613.29		
1	Corrected Gross Turbine Heat Rate	kCal/kwh	2120.61	2063.14	2008.78	1978.11		
2	Boiler Efficiency Test Result (LHV)	%	94.183	93.376	92.634	93.521		
3	Unit Nett Heat Rate (Corr)	kCal/kwh	2381.01	2311.95	2265.16	2203.52		
4	Plant Efficiency	%	36.11	37.19	37.96	39.02		

Secara umum terlihat bahwa dengan adanya kenaikan beban unit 5 maka terdapat tren sebagai berikut:

- 1. Nilai turbine heat rate gross (corr) semakin naik
- 2. Nilai efisiensi boiler semakin turun
- 3. Nilai heat rate unit netto (efisiensi termal plant) semakin naik

Sedangkan pada Unit 6, trend yang didapat saat terjadi kenaikan beban adalah:

- 1. Nilai turbine heat rate gross (corr) semakin turun (semakin baik)
- 2. Nilai boiler efisiensi cenderung bervariasi
- 3. Nilai heat rate unit netto (efisiensi termal plant) semakin turun (semakin baik)

Pemicu utama naiknya nilai heat rate unit adalah karena temperatur uap utama mengalami penurunan dengan naiknya beban unit 5. Sedangkan pada Unit 6, unit heat rate semakin baik seiring dengan kenaikan beban.

## Daftar Isi:

### Ringkasan Utama (Executive Summary)

- 1 Latar Belakang
- 2 Tujuan Melakukan Audit
- 3 Deskripsi Fasilitas yang Diaudit
- 4 Status Energi Saat Ini
- 5 Program Uji dan Metode
- 6 Persiapan dan Pelaksanaan Pengujian
- 7 Hasil
- 8 Diskusi Hasil
- 9 Potensi Efisiensi yang Dapat Dicapai
- 10 Rekomendasi dan Kesimpulan

#### **BAGIAN 1 - Latar Belakang**

Efisiensi termal dari unit pembangkit tenaga listrik dapat diwakili oleh heat rate (tingkat panas), yang merupakan ukuran dari jumlah energi (disini menggunakan satuan kCal) yang digunakan untuk menghasilkan satu satuan kilowatthour listrik. Sebuah unit pembangkit dengan heat rate yang lebih rendah, atau yang lebih efisien, dapat menghasilkan jumlah energi listrik yang sama sekalipun mengkonsumsi lebih sedikit bahan bakar, dibandingkan dengan unit pembangkit dengan heat rate yang lebih tinggi. Dengan demikian, heat rate yang lebih baik pada pembangkit listrik dapat menurunkan biaya bahan bakar dan membantu mencapai kepatuhan terhadap peraturan lingkungan.

Sebagian besar pembangkit listrik tenaga batubara dalam sistem grid Jawa Bali dirancang untuk operasi pada beban dasar (base load). Namun kondisi sebenarnya saat ini menunjukkan bahwa sebagian besar PLTU batubara beroperasi pada beban parsial, yang selalu berubah mengikuti permintaan beban yang diatur oleh PLN-P3B Pusat.

PLTU Paiton II, yang dioperasikan dan dipelihara oleh PT YTL Jawa Timur, mengoperasikan 2 unit (unit 5 dan unit 6) yang identik dalam hal : kapasitas dan spesifikasi komponen. PLN-P3B Pusat mempersyaratkan bahwa ke-2 unit tsb harus memikul tingkat beban yang sama dalam rentang pengoperasiannya. Namun data operasi kedua unit menunjukkan kecenderungan yang berbeda untuk parameter yang berhubungan langsung dengan tingkat kinerjanya, misalnya: suhu uap utama, suhu uap reheat dan suhu gas buang.

#### BAGIAN 2 - Tujuan Melakukan Audit

Pengujian heat rate unit 5 dan 6 bertujuan untuk melihat pengaruh perubahan beban unit terhadap heat ratenya. Dengan mengetahui trend heat rate terhadap tingkat beban tertentu dalam rentang operasi sehari-hari maka:

- 1. Dapat menentukan pola operasi pembebanan unit 5 yang terbaik, dan bila digabung dengan pola operasi pembebanan unit 6, akan menghasilkan heat rate plant yang optimum.
- 2. Mengurangi kerja siklik salah satu unit dengan cara memberikan prioritas perubahan beban terlebih dahulu kepada unit yang paling efisien pada tingkat beban lebih tinggi. Hal ini akan mengurangi laju kerusakan komponen utama unit.

#### **BAGIAN 3 - Deskripsi Fasilitas yang Diaudit**

Audit pengujian heat rate unit 5 dan 6 ini meliputi area boiler, turbin, dan auxiliary. Spesifikasi dari peralatan-peralatan di area tersebut dijelaskan sebagai berikut:

#### **BOILER**

Type : Outdoor, Forced Circulation, and Balanced Draft

Pulverizer Coal Fired, Tangential Firing & Low NO<sub>X</sub>

Manufacturer : ABB CE

Boiler Efficiency : 92.5 % at MCR (LHV Basis)

Design load	100% ( 650MW )	50% ( 325MW )
Coal	Kideco - roto	Kideco – roto
Superheater Flow	546 kg/s	263 kg/s
Superheater outlet temp.	543 °C	543°C
Superheater outlet press.	174.6 bar	104 bar
Drum Pressure	187.2 bar	110 bar
Reheater Flow	470 kg/s	235 kg/s
Reheater outlet temp.	540 °C	540°C
Feedwater temp	278 °C	240°C
Coal Fired	268.2 T/h	139.6 T/h
Approx. T/MW	0.412	0.429

Coal Storage Bunkers : 6 per unit

Coal Bunker Capacity : 6 x 500 Ton

Coal Mills / Feeders : 6 per unit

Mills Capacity : 6 x 66 T/h

Feeders Capacity : 6 x 89 T/h

Ignition fuel : Diesel Oil (Cap. Tank 720 M<sup>3</sup>)

Component	Capacity & description					
Fuel oil pump.	3 x 100 %, screw type					
Forced Draft Fan	2 x 50 %, Axial Type , TLT Babcock. Blade pitch controller.					
Induced Draft Fan	2 x 50 %, Axial Type , TLT Babcock. Blade pitch controller					
Primary Air Fan	2 x 50 %, Centrifugal Type , ABB Solyvent, inlet dampers					
I filliary All I all	controller					
Seal Air Fan	2 x 100%, Centrifugal Type					
Scanner air Fan	2 x 100%, Centrifugal Type					
Boiler Water Circ.	3 x 60%, Hayward Tyler Glandless motor, Single Stage					
Pump Centrifugal pump with Double Discharge						
Oil guns	30 % Boiler Load, HEA ignitor with atomises oil by					
Oii guiis	services air, 12 per Unit					

#### **BOILER GAS- PASS**

Design load	100 % ( 650 MW )	50% ( 325 MW )
Coal	Kideco – Roto	Kideco – roto
Air heater temp. inlet	372 °C	301 °C
Air heater temp outlet	127 °C	108 °C
Furnace pressure	-1.2 mbar	-1.2 mbar
Stack temp. outlet	76 °C	76 °C
Pri/ sec. Air temp inlet A/ HTR	32.2 °C / 27.2 °C	32.2 °C / 26 °C
Pri/ sec. Air temp outlet A/ HTR	357 °C / 341 °C	284 °C / 281 °C

#### **STEAM TURBINE GENERATOR SET**

Turbine Manufacturer : SIEMENS

Turbine Type : HMN Series 4 (1 HP, 1 IP, 2 LP)
HP Turbine : Single Flow, Double Shell, 14 stages

Barrel Type outer Casing

2 Combined Stop & Control Valves

IP Turbine : Double Flow, Double Shell Casing, 2x13 stages

2 combined stop & control valves

LP Turbine (2 Off) : Double Flow, Multi Shell Casing, 2x7stages

Condenser (2 Off) : \* Single Flow, Two lines, Titanium Tubes arranged in

series

\* Capacity : 580 m<sup>3</sup>

\* Pressure : -1 bar

\* Temp.max : 85 °C

Extraction Stage : 8 (HP: 1, IP: 3, LP: 4)

Rated Speed : 3000 rpm

Casings : 4 (1 HP, 1IP, 2 LP)

LP Exhaust Pressure : 0,0649 Bar

Evacuation pump : 3 x 50%, Liquid water ring Type

Tube cleaning : Sponge Balls Type

Design load	100 % (650MW)	75% (487MW)	50% (325MW)
Main Steam flow	546 kg/ s	400 kg/ s	264 kg/ s
Main Steam pressure	167 bar	128 bar	100 bar
Main Steam temperature	538 °C	538 °C	538 °C
Cold reheat temp	332 .2 °C	334 °C	330 °C
Cold reheat pressure	42. 7 bar	32 bar	21 bar
Hot reheat temp	538 °C	538 °C	538 °C
Hot reheat pressure	38.8 bar	29 bar	19 bar

Generator Type : THDF 115 / 67, 2 poles

Generator Rating : 789 MVA
Voltage Output : 21 KV
Frequency : 50 Hz
Power Factor : 0,85 Lag
Ampere : 21,692 A

H<sub>2</sub> Cooling Pressure : 4.5 bar, 2 x 100% Gas drier

Stator Cooling : primary water system, ion exchanger and alkalizer unit.

2 X 100 % pump with press. Disch. 5 bar

Seal oil : 3 X 100 % pumps, include 1 pump DC power supply

Excitation : - Pilot exc. : 220V / 195A, 400Hz

- Main exc. : \* 600V / 7500A

\* 820V / 10250A

Electrical Output (100%) : 650 MW (Gross), house load ± 29 MW

#### BAGIAN 4 - Status Energi Saat Ini

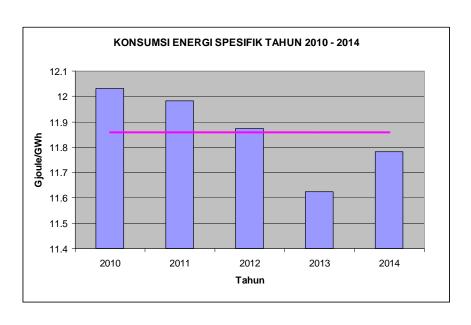

#### 4.1 Jumlah Produksi Tahun 2010 - 2015

Jumlah produksi listrik PLTU Paiton Unit 5 & 6 setiap tahunnya tidaklah sama. Jumlah produksi listrik ini dipengaruhi oleh permintaan pengiriman energi listrik oleh PT. PLN selaku pembeli (yang ditunjukkan oleh parameter *Load Factor*) dan juga lamanya unit *in service* tiap tahunnya. Untuk tahun 2015 ini Load factor rata-rata adalah 84.31%. Dari tabel dibawah dapat kita lihat jumlah produksi listrik, kebutuhan batubara dan konsumsi energi spesifik PLTU Paiton Unit 5 & 6 dari tahun 2010 sampai tahun 2015.

Konsumsi Energi Spesifik merupakan pembagian antara Pemakaian Energi (Gjoule) dan Produksi Listrik (GWh), dimana Pemakaian Energi (Gjoule) adalah gabungan antara konsumsi batubara, bahan bakar minyak dan kebutuhan listrik baik houseload maupun impor dari 150 kV PLN. Sedangkan Produksi listrik merupakan besarnya energi yang dihasilkan oleh 2 unit.

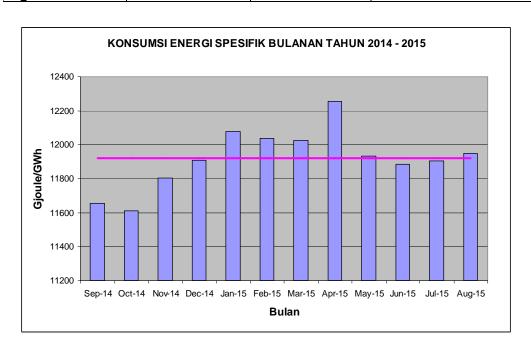

#### KONSUMSI ENERGI SPESIFIK TAHUN 2010 - 2014

Pemakaian Energi (GJoule) (A)		Produksi (GWh) (B)	Konsumsi Energi Spesifik (GJoule/GWh) (C=A/B)	
2010	101.187.333	8.410	12.031	
2011	97.801.413	8.162	11.982	
2012	100.339.444	8.450	11.874	
2013	93.708.605	8.062	11.623	
2014	99.351.307	8.433	11.781	

### **KONSUMSI ENERGI SPESIFIK BULANAN TAHUN 2014 - 2015**

Bulan	Pemakaian Energi (GJoule) (A)	Produksi (GWh) (B)	Konsumsi Energi Spesifik (GJoule/GWh) (C=A/B)
September 2014	9.270.801	795	11.655
Oktober 2014	9.708.359	836	11.610
Nopember 2014	7.661.449	649	11.803
Desember 2014	8.368.946	702	11.909
Januari 2015	7.883.849	653	12.076
Februari 2015	7.068.428	587	12.038
Maret 2015	8.668.088	721	12.027
April 2015	7.128.650	582	12.256
Mei 2015	9.037.551	757	11.931
Juni 2015	8.958.005	754	11.885
Juli 2015	7.919.575	665	11.903
Agustus 2015	6.750.779	565	11.951

#### BAGIAN 5 - Program Uji dan Metode

Program pengujian heat rate unit 5 dan 6 dilakukan dengan metode sebagai berikut:

- Rentang beban yang digunakan dalam pengujian heat rate mengacu kepada beban harian yang umum didapat, yaitu dari beban 450 MW sampai dengan beban penuh 100% 610 MW net. Untuk itu ditentukan 4 titik beban yang akan digunakan : 450 MW, 500 MW, 550 MW dan 610 MW net.
- 2. Tidak ada pengaturan kondisi operasi unit baik sebelum maupun saat pengujian berlangsung. Kondisi operasi yang digunakan adalah sebagaimana yang dilakukan sehari-hari. Jadi tidak mengacu kepada standar pengujian apapun, seperti yang biasa digunakan : ASME 4 (untuk boiler) dan ASME 6 (untuk turbin uap).
- 3. Unit dibiarkan stabil selama 0.5 jam sebelum memulai pengambilan data pengujian.
- 4. Hasil heat rate unit diperoleh dengan menghitung/mengdownload 3 komponen utama : turbin heat rate gross, efisiensi boiler dan daya auxiliary (auxiliary power)

#### BAGIAN 6 - Persiapan dan Pelaksanaan Pengujian

Tabel berikut mencantumkan tahap-tahap persiapan dan pelaksanaan pengujian heat rate unit 5 dan 6. Tahap dan urutan pelaksanaan pengujian ini berlaku umum untuk ke-4 tingkat beban

#### LANGKAH-LANGKAH PERSIAPAN DAN PELAKSANAAN PENGUJIAN HEAT RATE

Trend heat rate turbin untuk 4 tingkat beban ditunjukan dalam grafik berikut.

Gambar: Trend Gross Heat rate Turbin Unit 5 pada beban bervariasi

Gambar: Trend Gross Heat rate Turbin Unit 6 pada beban bervariasi

#### 7.2 Efisiensi Boiler

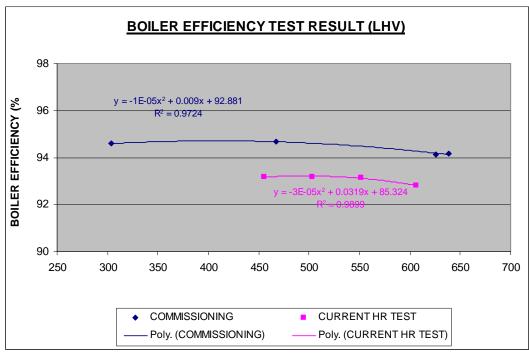

Hasil analisis lab untuk bahan bakar batubara yang digunakan dan parameter operasi unit 5 untuk ke-4 beban yang digunakan dalam perhitungan efisiensi boiler dirangkum dalam tabel berikut ini.

Hasil perhitungan efisiensi boiler dirangkum dalam tabel yang sama.

Trend efisiensi boiler untuk 4 tingkat beban ditunjukan dalam grafik berikut.

Gambar: Trend efisiensi boiler Unit 5 pada beban bervariasi

Gambar : Trend efisiensi boiler Unit 6 pada beban bervariasi

#### 7.3 Heat Rate / Efisiensi Termal

Perhitungan heat rate unit dilakukan dengan menggunakan rumus sbb:

Heat rate unit net = (HRTG) / (EB) \* (PP) (kCal/kWh), dimana :

HRTG = heat rate turbin gross

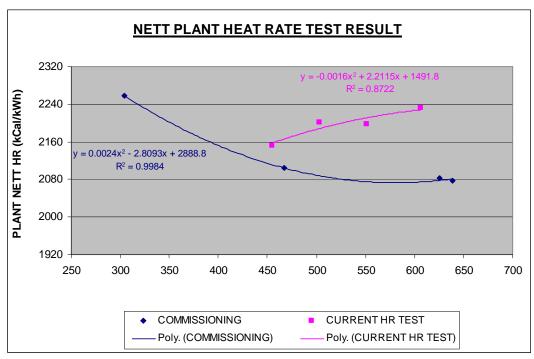

- EB = Efisiensi boiler

- PP = Parasitic power (lihat tabel perbandingan data sisi boiler di atas)

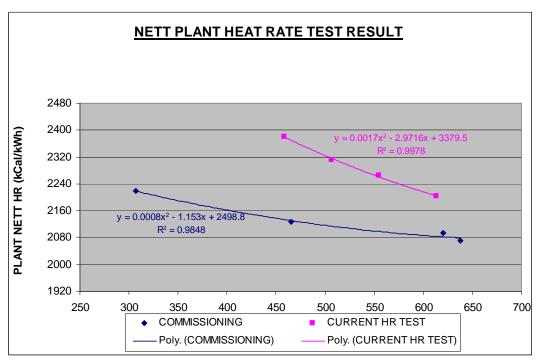

Sedangkan korelasi antara efisiensi termal unit dan heat rate unit net adalah sbb:

Efisiensi termal = 859.845 / (Net heat rate unit) (%)

Grafik berikut menunjukkan trend heat rate unit terhadap 4 tingkat beban.

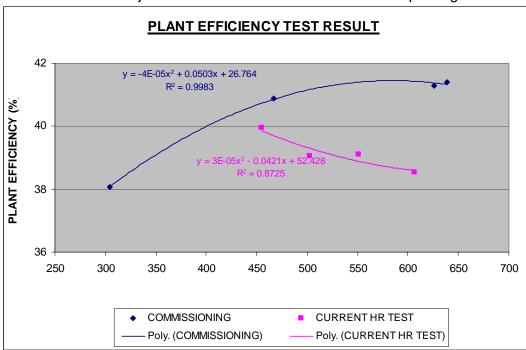

Gambar : Trend heat rate Unit 5 pada beban bervariasi

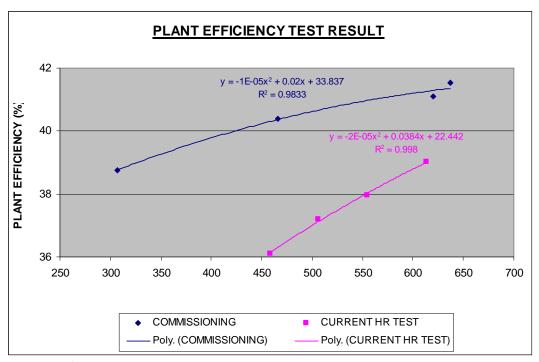

Gambar: Trend heat rate Unit 6 pada beban bervariasi

Grafik berikut menunjukkan trend efisiensi termal unit terhadap 4 tingkat beban.

#### **BAGIAN 8 - Diskusi Hasil**

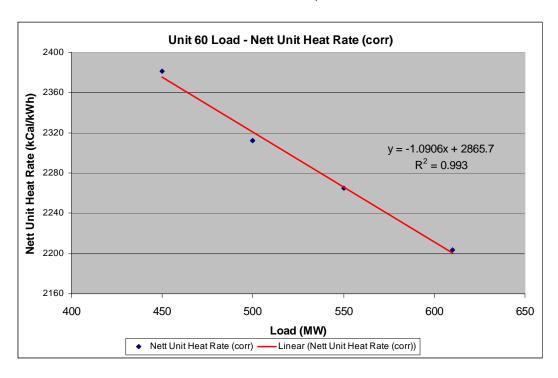

Dari hasil perhitungan untuk mendapatkan heat rate turbin gross, efisiensi boiler dan heat rate unit (efisiensi termal), dan grafik korelasi antara ke 4 parameter tersebut dengan beban yang berbeda terlihat bahwa:

- Pada Unit 5, terdapat perbedaan trend antara hasil komisioning dan kondisi saat ini untuk heat rate turbin gross, dimana kondisi saat ini mengalami penurunan heat rate turbin dengan naiknya beban unit. Faktor utama penyebab hal itu adalah karena temperatur uap utama (main steam temperature) mengalami penurunan dengan naiknya beban.
- 2. Terdapat persamaan trend antara hasil komisioning dan kondisi saat ini untuk efisiensi boiler, dimana efisiensi boiler mengalami penurunan dengan naiknya beban.
- 3. 2 point di atas menyebabkan heat rate unit (dan efisiensi termal) untuk kondisi saat ini mengalami penurunan dengan naiknya beban, hal yang berbeda bila dibandingkan dengan hasil komisioning. Heat rate turbin merupakan faktor penentu (determining factor) yang mengubah arah trend heat rate unit tersebut.
- 4. Sedangkan pada unit 6, trend gross turbine heat rate antara kondisi saat ini dengan saat komisioning masih sama, yakni cenderung naik (semakin kecil) seiring dengan kenaikan beban (load). Begitu pula dengan trend boiler efisiensi dan plant net heat rate.

BAGIAN 9 - Potensi Efisiensi yang Dapat Dicapai

Gambar : Trend heat rate Unit 5 pada beban bervariasi

Gambar : Trend heat rate Unit 6 pada beban bervariasi

Dari kedua grafik di atas terlihat bahwa heat rate Unit 5 semakin besar seiring dengan kenaikan beban (*load factor*). Sedangkan heat rate unit 6 berlaku sebaliknya, yaitu heat rate semakin rendah (semakin baik) dengan kenaikan beban (*load factor*).

Berikut adalah tabel pembebanan untuk tahun 2014. Dari sini kita bisa mengetahui tingkat pembebanan kedua unit dari dispatch terendah 650 MW hingga beban penuh 1220 MW. Dari tabel terlihat bahwa potensi penghematan dapat diperoleh dengan pembebanan antara 700 MW – 1150 MW. Pembebanan ini apabila di jumlahkan selama 1 tahun adalah selama 4037 jam operasi atau setara dengan 46.0845% dari total jam operasi pembangkitan. Asumsi ini dipakai untuk menentukan besar perkiraan penghematan selama 1 tahun.

650	325	2107	325	2511	325	2107	325	2511	2309	2309	0	0

Jumlah service hour pada beban  $700 - 1150 \, MW = 4037$  jam Prosentase service hour  $700-1150 \, MW$  selama 1 tahun = 46.08 % Dengan melihat ke load factor *station* rata-rata tahun Bulan Agustus '14 – Agustus '15 sebesar 85.21 % sebagai acuan untuk asumsi LF rata2 ke depan bisa diperoleh besarnya heat rate dari persamaan regresi tersebut. Pada asumsi LF tersebut, unit berada pada beban 1039.56 MW. Pada saat kondisi normal, unit akan didispatch dengan beban yang sama yakni sekitar 520 MW. Dari grafik Net unit heat rate diatas, didapatkan besar heat rate unit 5 adalah 2192.8 kcal/kWh, sedangkan heat rate unit 6 adalah 2298.8 kcal/kWh.

Dari sini terlihat bahwa pada LF 84.31% unit heat rate pada unit 6 lebih tinggi dibandingkan unit 5. Untuk mendapatkan unit heat rate yang optimum, sebaiknya unit 6 dioperasikan dengan beban penuh yaitu 100% (610 Mw nett), sedangkan unit 5 memikul beban sisanya yaitu 68.6% (430 MW nett)

Asumsi	LF = 85.21%	atau setara =	1039.562	MW	
Unit	Beban awal MW	HR kCal/kWh	Beban variasi MW	HR kCal/kWh	Potensi

=	115,153.14	ton/year	
		•	

Selisih dari heat rate unit 5 sebelum dan setelah dilakukan optimasi sebesar 39.71 kcal/kwh, sedangan Unit 6 sebesar 98.39 kcal/kwh. Total potensi penghematannya adalah 138.11 kCal/kWh. Potensi penghematan ini setara dengan penghematan batubara sebesar 56,328.77 ton dan pengurangan emisi CO<sub>2</sub> sebesar 115,153.14 ton per tahun.

#### BAGIAN 10 – Rekomendasi dan Kesimpulan

Dari diskusi hasil pengujian pada bagian 8 tersebut di atas dapat disimpulkan bahwa kenaikan beban menyebabkan heat rate unit mengalami penurunan (nominal heat rate unit mengalami kenaikan), yang terutama dipicu oleh turunnya temperatur uap utama.

Untuk mendapatkan nilai optimum dari heat rate plant terhadap perubahan beban plant maka direkomendasikan **Rencana Kerja Efisiensi Energi** sbb :

- 1. Melakukan langkah-langkah perbaikan kondisi operasi unit 5 agar temperatur uap utama bisa meningkat (atau minimum tidak menurun) dengan naiknya beban unit.
- 2. Dari test yang sudah dilaksanakan di ketahui bahwa unit 6 lebih efisien saat berada di beban tinggi dan sebaliknya unit 5 lebih efisien saat di beban rendah. Oleh karena itu, bila diminta menaikkan beban oleh PLN-P3B maka diusahakan agar beban unit 6 yang terlebih dahulu dinaikan hingga ke beban maksimum, baru kemudian disusul menaikan beban unit 5 hingga mencapai dispatch plant yang sesuai dengan permintaan PLN-P3B.
- 3. Akan dilakukan pengetesan ulang untuk unit 6 pada 2 beban (450 MW dan 610 MW) untuk memverifikasi data yang sudah ada. Pengetesan akan dilaksanakan setelah unit outage bulan April 2016. Hal ini di maksudkan untuk melihat konsistensi dari trend pengukuran yg sudah ada. Apabila trend unit heat rate konsisten maka rekomendasi dari Audit Internal ini dapat dilaksanakan.
